🎓 EDUCATION

Jilin University (JLU), Jilin, China

B.S. in College Of Automotive Engineering

Sep. 2022 – Jun. 2026

Master in College Of Automotive Engineering

Sep. 2026 – Jun. 2029

👥 EXPERIENCE

HKUST(GZ)

Aug. 2025 – April. 2026

Research on LLM Uncertainty and Embodied AI collaborated with: [Prof. Sihong Xie](#)

Introduction: Research on uncertainty in large language models mainly centers on the internal knowledge flow pathways of these models. One paper on uncertainty in model question answering has been accepted as an oral presentation at [ICML 2026](#). In addition, one paper on scene graph generation has been accepted at [ECCV 2026](#).

Tsinghua University, Institute for AI Industry Research (AIR)

Dec. 2024 – Apr. 2025

Research on Computer Vision collaborated with: [Prof. Hao Zhao](#)

Introduction : I chose YOLO as the basis and proposed the YOTO model. YOTO maintains the consistent speed of YOLO and its mean average precision (mAP) is close to the state-of-the-art level. YOTO is a highly deployable, high-speed, and lightweight model for task-oriented detection. To make the most of pre-trained object detection models, I introduced a distillation framework and integrated a text encoder to unify task-oriented detection and object detection via text prompts. This framework can fully tap the potential of mature classification algorithms. Moreover, it also solves the problem of insufficiently rich task-oriented datasets.

The State Key Laboratory of Automotive Simulation and Control (ASCL) Oct. 2023 – Dec. 2024

Research on Intelligent Cockpit Technology collaborated with: [Prof. Rui Zhao](#) and [Prof. Fei Gao](#)

Introduction : I developed a data-driven framework for digital modeling and recognition of human-vehicle cabin interaction scenarios by mining big data from driving behaviors. Constructed a large-scale interaction dataset and fine-tuned a dedicated intent prediction model using LoRA (Low-Rank Adaptation), achieving high-precision recognition with superior generalization capability. (First-authored paper published in [Sensors](#)). We proposed a reinforcement learning framework integrating offline expert-guided pre-training with online Twin Delayed Deep Deterministic Policy Gradient (TD3) algorithm, establishing a dual-layer optimization architecture. This approach achieves centimeter-level path tracking accuracy while simultaneously optimizing passenger comfort metrics. (Second-authored paper published in [Sensors](#)).

⚙️ SKILLS

- Programming Languages: Python > C.Proficiency in the PyTorch framework
- Platform: Linux
- Writing Tool : $\text{\LaTeX}$

♡ HONORS AND AWARDS

The national outstanding award of Zhou Peiyuan Mechanics Competition

June. 2025

The Third Place in Jilin Province in The 26th China Robot and Artificial Intelligence Competition

Jun. 2024

Third-Class Scholarship

Sep. 2024

Third-Class Scholarship

Sep. 2025

Jilin University Academic and Technological Award

Sep. 2025
